The method is performed in vivo or in vitro. APO polypeptides are all useful as immunogens for preparing antibodies. APO4 is also useful for diagnosis/treatment of developmental or gestational abnormalities. APO8 was transfected to human breast carcinoma cell line MCF-7, and induced apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                    δÃ
                                                                                                                                                                                                                                                                                                                   A single-stranded DNA (or its complementary strand or the corresp. C double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the G' '-end of mRNA by using poly(T) as the sole primer. Since the 3'-C untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

CC polypeptide (III) comprising a portion of a colon tumour protein. A new color tumour protein of a colon tumour protein for determining the presence of a cancer in a patient. (II) or antigen cC determining the presence of a cancer in a patient. (II) or antigen cC presenting cells expressing (I) are useful for stimulating and/or cC expanding T cells expressing (I) are useful for stimulating and/or cC expanding T cells specific for a tumour protein, by contacting T cells (I), (II), (II), (II), (II), (II), or antigen presenting cells that express (II) are useful for treating CC colon cancer in a patient by incubating CD4+ and/or CD8+ T cells isolated CC from a patient with (I), (II), or antigen presenting cells that express (II), so that T cells proliferate, and administering to the patient an CC effective amount of the proliferated T cells, thus inhibiting the CC development of a cancer in the patient. A new composition is useful for CC vaccines and pharmaceutical compositions for prevention and treatment of CC colon cancer and for the diagnosis and monitoring of the cancers. (I), (II) or an antibody against (II) is useful for detection, diagnosis and/or therapy of human colon cancer. (I) is useful as a probe or primer for nucleic acid hybridisation, and in the design and preparation of ribozyme colon cancers in thibiting expression of (II) in tumour cells. ABK29475—cc ABK29851 represent human colon adenocarcinoma-specific cDNA sequences of the invention.

The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and

CC comprising the sequences given in AAZI2532 to AAZI7779. Also described is camerindo of detecting differentially expressed genes correlated with the CC cancerous state of a mammalian cell, comprising detecting at least one CC differentially expressed gene product in a test sample from a cell cosuspected of being cancerous, where the gene product is encoded by one CC of the 5248 polynucleotide sequences given in AAZI2532 to AAZI7779. The CC polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, cm apphing, tissue typing or profiling, forensics, genetic analysis and CC can be used for raising antibodies for experimental, diagnostic and CC can be used for raising antibodies for experimental, diagnostic and CC can be used for raising antibodies for experimental, diagnostic and CC carays for diagnostics (which may be used to determine function of an CC encoded protein); and to detect differences in expression levels between CC diagnostic, e.g. to identify abnormal or diseased tissue in a human, to CC concer). The polynucleotides or susceptibility to a disease such as CC cancer). The prognosis and management of colorectal cancer, breast cancer, cc and lung cancer. The polynucleotides can also be used to screen for cc peptide analogues and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Pred. No. is the number of results predicted by chance to have

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* consists of 7 contigs. The true order of the pieces

is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

                                                                                                                                                                                                                    only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; SW:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (17-NOV-2001) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk On Nov 20, 2001 this sequence version replaced gi:16605765. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with

It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
